背景介绍	ADAM metalloproteinase domain 32(ADAM32) Homo sapiens This gene encodes a member of the disintegrin family of membrane-anchored proteins that play a role in diverse biological processes such as brain development, fertilization, tumor development and inflammation. This gene is predominantly expressed in the testis. The encoded protein undergoes proteolytic processing to generate a mature polypeptide comprised of an metalloproteinase, disintegrin and epidermal growth factor-like domains. This gene is located in a cluster of other disintegrin and metalloproteinase family genes on chromosome 8. Alternative splicing results in multiple transcript variants encoding different isoforms.
