| 背景介绍                | This gene encodes a molecular chaperone which binds specifically to free alpha-globin and is involved in hemoglobin assembly. The encoded protein binds to monomeric alpha-globin until it has been transferred to beta-globin to form a heterodimer, which in turn binds to another heterodimer to form the stable tetrameric hemoglobin. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Dec 2015], |
| 细胞定位                | Cytoplasm .                                                                                                                                                                                                                                                                                                                                                                                                                              |
| 纯化                  | The antibody was affinity-purified from rabbit antiserum by affinity-chromatography using epitope-specific immunogen.                                                                                                                                                                                                                                                                                                                    |
| Clonality           | Polyclonal                                                                                                                                                                                                                                                                                                                                                                                                                               |
