| 背景介绍                | This gene encodes a tyrosine protein kinase, which maybe involved in the regulation of mast cell degranulation, and erythroid differentiation. Alternatively spliced transcript variants encoding different isoforms have been found for this gene . [provided by RefSeq, Jul 2011],                                                                                                                                                                                                                 |
| 细胞定位                | Cell membrane. Nucleus. Cytoplasm. Cytoplasm, perinuclear region. Golgi apparatus . Membrane ; Lipid-anchor . Accumulates in the nucleus by inhibition of CRM1-mediated nuclear export. Nuclear accumulation is increased by inhibition of its kinase activity. The trafficking from the Golgi apparatus to the plasma membrane occurs in a kinase domain-dependent but kinase activity independent manner and is mediated by exocytic vesicular transport. Detected on plasma membrane lipid rafts. |
