背景介绍	This gene encodes a cytokine that functions in inflammation and the maturation o f B cells. In addition, the encoded protein has been shown to be an endogenous py rogen capable of inducing fever in people with autoimmune diseases or infections. The protein is primarily produced at sites of acute and chronic inflammation, wh ere it is secreted into the serum and induces a transcriptional inflammatory res ponse through interleukin 6 receptor, alpha. The functioning of this gene is impl icated in a wide variety of inflammation-associated disease states, including sus ceptibility to diabetes mellitus and systemic juvenile rheumatoid arthritis. Alte rnative splicing results in multiple transcript variants. [provided by RefSeq, De c 2015],
