背景介绍	This gene encodes a cysteine-rich acidic matrix-associated protein. The encoded protein is required for the collagen in bone to become calcified but is also invol ved in extracellular matrix synthesis and promotion of changes to cell shape. The gene product has been associated with tumor suppression but has also been corre lated with metastasis based on changes to cell shape which can promote tumor cel l invasion. Three transcript variants encoding different isoforms have been foun d for this gene. [provided by RefSeq, Jun 2015],
