背景介绍	Protein ubiquitination controls many intracellular processes , including cell cycle progression , transcriptional activation , and signal transduction. This dynamic process , involving ubiquitin conjugating enzymes and deubiquitinating enzymes , adds and removes ubiquitin. Deubiquitinating enzymes are cysteine proteases that specifically cleave ubiquitin from ubiquitin-conjugated protein substrates. This gene encodes a deubiquitinating enzyme which lies in a gene cluster on chromosome Xp11.23 [provided by RefSeq , Jul 2008] ,
