| 背景介绍                | This gene encodes a molecular chaperone that is a member of the chaperonin containing TCP1 complex (CCT) , also known as the TCP1 ring complex (TRiC) . This complex consists of two identical stacked rings , each containing eight different proteins. Unfolded polypeptides enter the central cavity of the complex and are folded in an ATP-dependent manner. The complex folds various proteins , including actin and tubulin. Alternative splicing results in multiple transcript variants. Related pseudogenes have been identified on chromosomes 5 and 6. [provided by RefSeq , Oct 2009] , |
